KNOW THE WEATHER
By E. H. Sims

Which is heavier, cold air or warm air?

Cold air is heavier than warm, as most people know. Cold air is denser. The principle of warming the air to fill a balloon, which will then rise, is well known.

Not as well understood is the characteristic of warm and cold fronts stemming from this weight factor. A cold front slides over the earth's surface, leading edge hugging the surface, slanting backward.

The warm front's leading warm air is high, the frontal edge leaning forward. This allows the keen observer to spot an approaching warm front by detecting the meaning high cirrus clouds that move in from the west.
